SEFI Unified-Field Visualization Engine v0.1 Design and Development Plan

Jason Dutton
SEFI Work File (Non-Canonical)

August 20, 2026

Purpose

The SEFI Unified-Field Visualization Engine (UFVE) is a software system designed to simulate and visually render SEFI geometric structures, including warp-metric manifolds, curvature density, tension routing, coherence fields, and worldline continuity. Version 0.1 aims to produce a functional prototype suitable for research, demonstration, and further development.

1 Project Objectives

- Implement a basic SEFI manifold representation.
- Implement core SEFI operators (warp, tension, coherence) in simplified form.
- Create a time-evolution engine for manifold dynamics.
- Render curvature, tension, and worldlines in real-time 3D.
- Provide interactive controls for parameter adjustment and probing.
- Establish a modular architecture for future expansion.

2 Team Structure

2.1 Roles for Physics Students

- **Geometric Modeling Lead:** Defines manifold structures and operator behavior.
- **Simulation Physicist:** Implements time-evolution rules and stability constraints.
- **Visualization Physicist:** Maps SEFI quantities to visual elements (color, vectors, flows).

2.2 Roles for Software Developers (Optional)

- **Engine Programmer:** Builds core simulation loop and rendering pipeline.
- **UI/UX Developer:** Implements controls, sliders, toggles, and interaction tools.

3 System Architecture

3.1 Layer 1: Mathematical Core

- Manifold representation: 2D height map or parametric surface.
- Operators:
  - Warp operator $W(x, y)$
  - Tension operator $T(x, y)$
  - Coherence operator $C(x, y)$
- State vector: $\Phi(t) = \{W, T, C, \text{curvature}, \text{worldlines}\}$.

3.2 Layer 2: Simulation Engine

- Discrete time-step evolution: $t \to t + \Delta t$.
- Update rules for curvature and tension.
- Worldline propagation through the manifold.
- Stability handling (damping, smoothing).

3.3 Layer 3: Visualization Layer

- 3D rendering (Unity, Unreal, or OpenGL).
- Color maps:
  - Curvature $\to$ heatmap
  - Tension $\to$ vector field
  - Coherence $\to$ transparency or glow
- Worldline tracing with dynamic path rendering.

3.4 Layer 4: Interaction Layer

- Parameter sliders (warp strength, tension density).
- Toggle fields on/off.
- Probe tool for sampling local curvature.
- Start/stop/reset simulation controls.

4 Development Phases

4.1 Phase 1: Mathematical Foundations

- Define initial manifold.
- Implement simplified operators.
- Establish update equations.

4.2 Phase 2: Simulation Prototype

- Build time-evolution loop.
- Add worldline propagation.
- Validate stability.

4.3 Phase 3: Visualization Prototype

- Render manifold surface.
- Add curvature and tension overlays.
- Implement worldline tracing.

4.4 Phase 4: Interaction Tools

- Add UI controls.
- Implement probing tools.
- Add parameter adjustment.

4.5 Phase 5: Testing and Refinement

- Validate physical behavior.
- Optimize performance.
- Document architecture for future versions.

5 Deliverables

- Working UFVE v0.1 executable.
- Source code repository.
- Documentation for physics students and developers.
- Demonstration video or live demo.

6 Future Expansion

- Full 3D manifolds.
- SEFI:DNA biological geometry overlays.
- SEFI cosmology evolution modules.
- Multi-operator compatibility testing.
- VR/AR immersive unified-field environments.
